

## Case study on Hive Joins

We have two datasets named emp.txt and dept.txt in which the following columns are given:

emp.txt	dept.txt
Id	deptId
emp_name	deptName
salary	
deptId	

**Problem statement:** Create hive tables for the given datasets and perform the following join operations on the same:

1. Inner join
2. Left outer join
3. Right outer join
4. Full outer join
5. Left semi join
6. Mapside join
